Supporting information for DEB IPM (temporary)

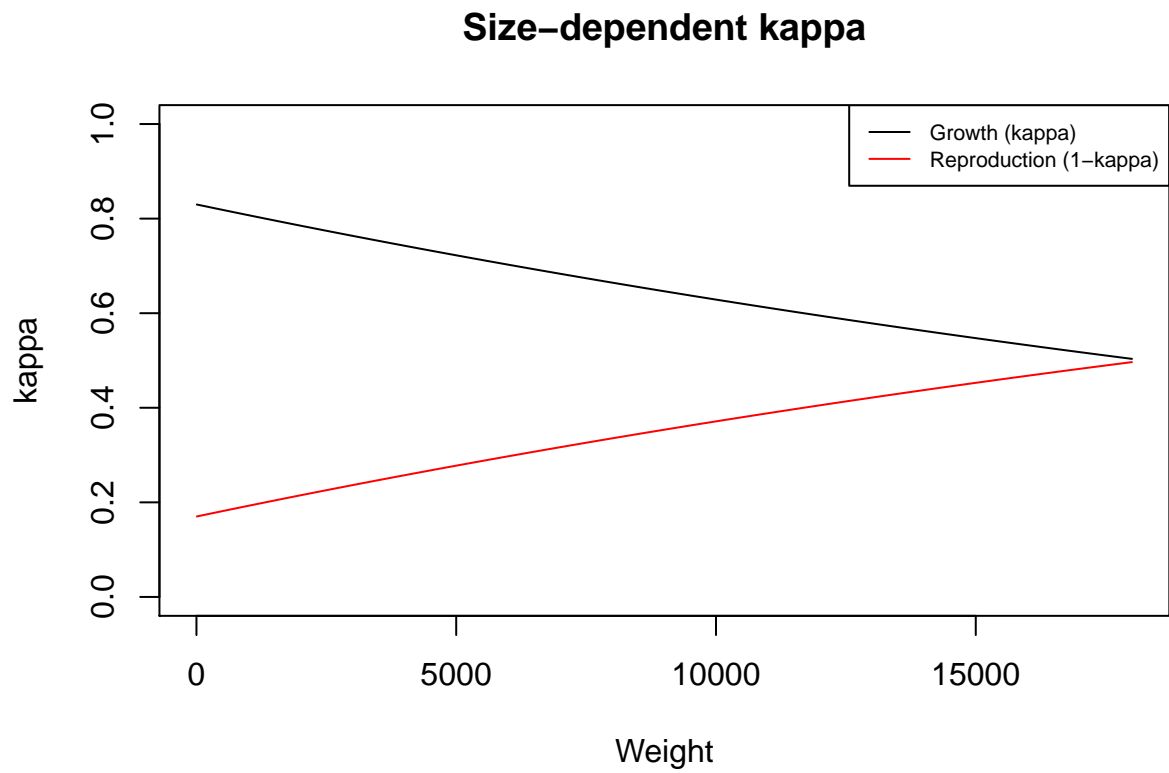

- A1. Effects of size and temperature on maintenance, consumption and energy budget.
- A2. Growth trajectories and fecundity at for optimal allocation (κ_0^*)
- A3. Fitness landscape & stable size structure for contrasting survival scenarios
- A4. Optimal allocation strategy when κ is fixed for in the first year of growth.

A1. Effects of size and temperature on maintenance, consumption and energy budget

Effects of temperature on maintenance and consumption Effects of temperature on maintenance and consumption

Size dependent Kappa function (k(m), k_0=0.83, k_m=2) Size dependent Kappa function (k(m), k_0=0.83, k_m=2)

Effects of temperature on size dependent energy budget Effects of temperature on size dependent energy budget

A2. Growth trajectories and fecundity at for optimal allocation (κ_0^*)

Growth trajectories and fecundity at for optimal allocation (κ_0^*)

Figure A2. Growth trajectories (A) and fecundity (B) predicted from the optimal allocation strategy (k_0^*) at five temperatures and contrasted by growth and fecundity for $k_0=0.83$ (i.e. k_0 used in for tuning the model).

A3. Fitness landscape & stable size structure for contrasting survival scenarios

Fitness landscape & stable size structure for contrasting survival scenarios

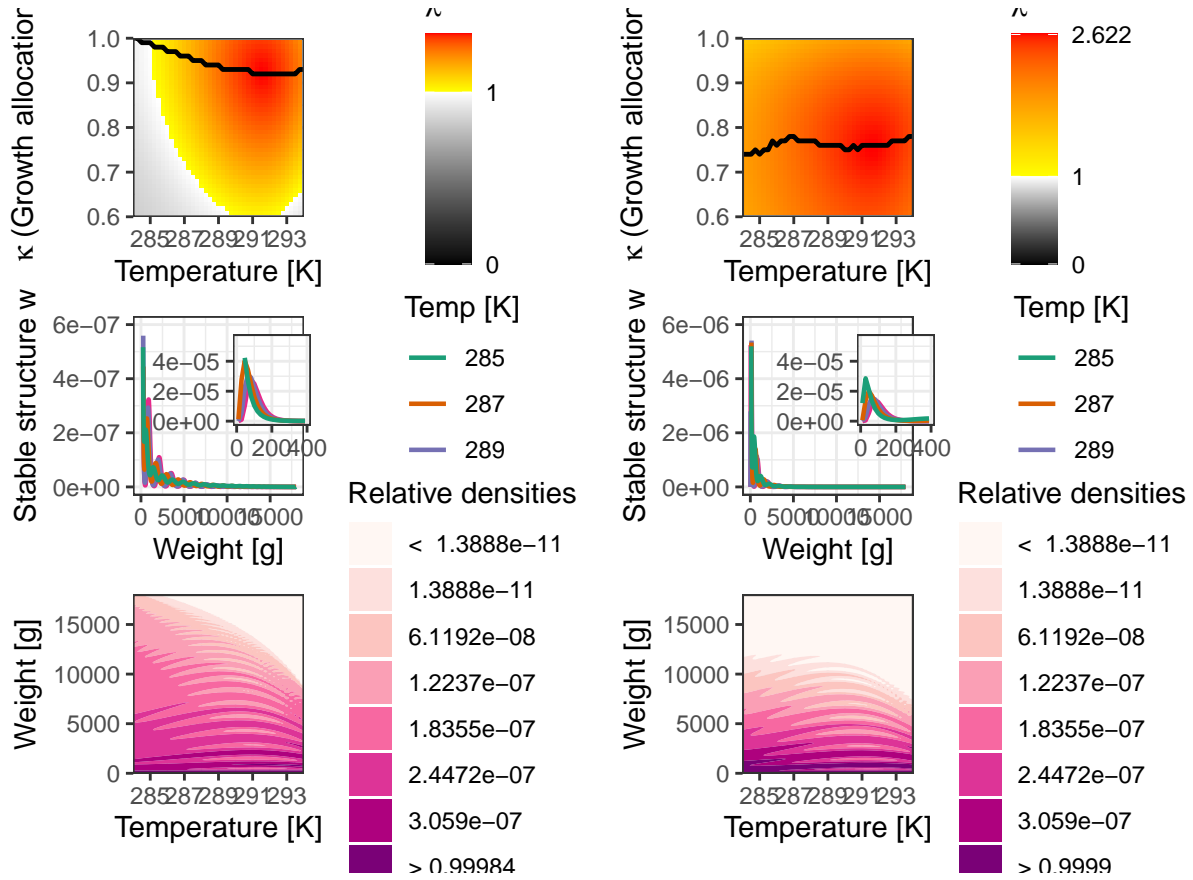

Figure A3. Fitness landscape (A,B) with solid line representing optimal allocation strategy (κ_{0^*}) and stable structure w for four temperatures (C,D) and over temperature (E,F) for survival contrast $a(x)$ (A,C,E) and $a=0.68$ (B,D,F).

A4. Optimal allocation strategy when kappa is fixed for in the first year of growth.

By setting kappa to 1 in the vital rate function describing first year growth (DEBage1.size), we see that optimal allocation can be substantially lower.
